Challenge Brief

Template for challenge partners · Since AI Hackathon 2026 · 6–8 Nov 2026, Turku

This template helps you define a clear, buildable challenge for the hackathon. Fill in each section below — the more concrete the problem and the evaluation criteria, the better the prototypes you receive. You can return it to us as is, and we are happy to help shape it into a ready event challenge.

Questions about the template? Riku Lauttia · riku.lauttia@sinceai.fi · +358 40 938 8820

Challenge partner (company)

Apetit Plc

01 Challenge Title

A short, memorable name for the challenge. Example: “Automated support ticket routing.”

Climate & Nature Navigator

02 Problem Statement

What business or technical problem should be solved? Describe the context, why it matters, and the main pain points.

We need an artificial intelligence solution that transforms fragmented climate and nature data into decision-making platform. The application utilizes already automated Group-wide GHG emissions calculation data, including data from farmers and third-party data sources, . The solution also simulates SBTi target pathways and required actions with cost-estimates. It prepares forecasts of the development of emissions according to publicly available scenarios and industry road maps. Important part of the solution is to estimate business risks and costs according to different climate scenarios, focusing especially on farming conditions in changing climate.
At the same time, it combines emissions, raw material and geospatial data to prioritize nature-related impacts and dependencies in line with the SBTN framework.

Results in the system are traceable, source-based and subject to expert review and approval. The idea is to achieve better internal overview on climate and nature-related impacts (e.g. impacts on biodiversity, eutrophication, water availability) in two ways: to improve processes of climate impact calculations, but to include AI in the process in a way,that we do not merely calculate the past, but identify the most impactful climate and nature actions and risks for the future based on science-based scenarios and data. To make measurement of nature-related impacts possible, the system has to be designed in a way, that enables use of geospatial data in further development phases.

03 Guiding Question

One question that focuses the challenge. Example: “How might we use AI to predict equipment failures before they happen?”

How can AI help us to understand, prioritize and quantify climate and nature impacts across the value chain, and turn sustainability data into actionable decisions while taking into consideration different future climate scenarios?

04 Recommended AI Approaches *Optional*

Any relevant technologies, models or methods — for example NLP for text analysis, classification, knowledge graphs, agents, or RAG.

Preferred technology stack for potential implementation at Apetit: Microsoft Azure, Microsoft Fabric, Azure AI Foundry and the Microsoft Copilot ecosystem.

Suggested approaches include:

Retrieval-Augmented Generation (RAG) for integrating sustainability frameworks, standards and guidance (e.g. GHG Protocol, SBTi, SBTN, CSRD).

AI agents for automated data collection, validation, quality assessment and recommendation generation.

Machine learning and predictive analytics for climate scenario modelling, emissions forecasting and risk assessment.

Knowledge graphs for linking emissions, sourcing, supplier, financial and geospatial datasets.

Geospatial AI for nature impact hotspot identification and prioritisation.

Explainable AI (XAI) methods to ensure transparency, traceability and auditability of decisions and recommendations.

Natural Language Processing (NLP) for interpreting sustainability frameworks, guidance documents and expert comments.

Digital twin or scenario simulation approaches to evaluate alternative decarbonisation and nature-positive pathways.

Teams are encouraged to combine multiple methods and demonstrate how AI-generated insights remain transparent, traceable and subject to expert review.

Hackathon access to be confirmed: until Microsoft accounts, permissions and usage capacity are arranged for participating teams, this stack is a preference rather than a requirement. Teams may use other suitable tools and explain how their solution could later fit Apetit's ecosystem.

05 Dataset or API Provided *If any*

Describe any data or resources you provide: format, a link if ready, and sample size. If none, state what builders should expect.

> At Since AI, challenges can be built with synthetic, anonymized or public data — no personal data is required.

Apetit provides a mock data package (sourcing, energy, GHG inventory). Since AI has extended it into a synthetic dataset calibrated to Apetit's sample and public statistics: contract farms and field parcels, 2021–2025 corporate activity data in raw formats, daily weather 1991–2060 under three climate scenarios, catchments and nutrient loads, transition scenarios and a lever catalogue. All data is synthetic; no Apetit confidential data is used. Apetit also provides publicly open scientific frameworks to be used for

the teams.
In addition, when needed, teams may use synthetic and appropriately licensed public data, stating their assumptions and data sources.
Package: APETIT_CLIMATE_NATURE_NAVIGATOR_2026.zip (start with START_HERE.html).

06 Evaluation Criteria

How should solutions be judged? What matters most — for example accuracy, scalability, usability, or business impact?

Combination of automation of reporting and intelligent integration with given frameworks and climate scenarios to ensure reliable data handling and meaningful and material insights for future scenarios and support decision-making. Reliability and transparency to ensure audit trail.
Teams may address one or several parts of the challenge. Judge demonstrated usefulness, sound reasoning and traceability rather than the number of topics covered or a particular technology stack.

07 Submission Format

What deliverables do you expect? For example a demo video, pitch slides, a code repository, or documentation.

Working AI solution and documentation of the solution with usage instructions.

08 Point of Contact

Name, email and preferred contact method for questions during the hackathon.

Jani Kielenniva, jani.kielenniva@apetit.fi
Minna Päällysaho, minna.paallysaho@apetit.fi
